

Wasting time entering data into spreadsheets? There is a better way

If your operations rely on spreadsheets and databases, you will already understand how time-consuming and labour intensive they can be. And when you are dependent on these spreadsheets to inform the business decisions you make every day, you'll know how prone they are to error, through duplication, mis-keyed or out of date information.

As spreadsheets multiply across your business and your business grows, so do the errors. Different parts of the business, such as purchasing, stock, recipes, production, sales, will all need different views of the data. Day to day, this may work for you, but what happens when you need to audit, prove traceability or reconcile P&L in your business? Without a single view based on real-time data, you're unlikely to get to a consistent report, without expending considerable time, effort and frustration.

Say goodbye to siloes

When you move from disparate spreadsheets to automation, the result is clarity across your food productivity operation. Real-time data capture and reporting, a single, live view of your business, information analysis delivered in seconds and that can be relied upon. You will achieve accuracy across everything from sales forecasts, stock values, pricing through to the status of your production.

You'll have confidence in your management reports and in your business critical data; information will be at hand to demonstrate quality assurance and traceability; variabilities, such as raw materials and labour can be assessed in real time.

With a single real-time view and the elimination of siloed spreadsheets and data, the chance of human error will be significantly reduced and you will have the reassurance of data that provides true business intelligence.
